Boris, 720

704

724 I am using the system now for a year and I loved it. What I found is that the material has excellent hemostatic properties. After applying the material for 2 minutes, you have to rinse it out with waterspray and You have to do this vigorously. I never had any bleeding after that and the prep is squaky clean and the margins are easily readable. Personally I would not go back again to cord. The higher price is compensated by less retakes and less redos.

720 Hope this helps, 706 708 710 712 714

724 as far as a hemostatic agent, it is great. I'm talking no bleeding after it sits for a couple of minutes. As far as retraction goes, I would say its ok, kind of hard to get into the sulcus to the point of retracting the tissue IMO. I tried a combo of packing a 00 cord with expasyl on top and that really worked well, too. But if its bleeding like a stuck pig, give it a try. I guarantee it'll be dry. (I'm a poet and didn't know it). Also really have to wash it off with pressure and make sure its out of the sulcus, will inhibit PVS

724 I have used Expasyl for some time now and think it is great. First time I used it, however, I thought it was terrible. Takes a little practice and getting used to. Thankfully, tried it again and realized its potential. My lab tech says my margins have never been better.

Keep in mind, that often you will not get the amount retraction you get with cord, but the fact that it is a clean, dry prep more than offsets this concern. The margins will be there.

Sometimes it is difficult to get it all out of the sulcus, but I will simply take an explorer or perio probe and clean this out. Even after this, no bleeding.

On rare occasions, there will be a margin that is not completely visible. I will then take a cord packing instrument and pull the tissue back and hold for 20-30 seconds. This will generally give you the retraction you need at this one spot and you can then take your impression. Again, no bleeding!

Another use I have found for it is prior to bonding porcelain crowns or veneers. If you have an area where you are getting some seepage, you can simply place the Expasyl for a few minutes, rinse and no bleeding!

Does this affect bond strength? Honestly, I do not know. Think I might ask John Kanca.

All in all a good product. Not perfect but quite helpful.

There are times my husband says he will still pack a cord and then he uses the Expasyl on top of the cord and washes it off, leaving the cord in while taking an impression-- kind of like the double cord technique taught by G. Christensen only he uses a regular retraction cord and the Expasyl in place of the second cord.

He says he loves it. Thinks it is great.

I've been using Expasyl for over a year. Works great-- usually as the second "cord" in the dual cord technique if the gingiva bleeds. I leave the 00 and rinse off the Expasyl. I have heard of it inhibiting PVS setting but have never experienced it.

Boris,
I am actually a dealer rep in Wisconsin, and when Expasyl first came out they would let you try it for 30 days, and give it back no questions asked if you didn't like it. I think in 2 months I had 25-30 people try it. Out of that many people I had 2 returned. One of them was not even opened (never got around to trying it, his assistants

 Just had a Kerr rep stop by the office with some info about the Expa-syl system for retraction instead of packing cord. Anyone tried this? What do you think?

posted 08-27-2002 09:52 AM

 As for Expa-syl not retracting the tissue as much as cord, try this:
 Get a Comprecap set from Roeko for about \$25, they are nothing more than 3 different sizes of what looks like a hollowed out, stiff cotton roll. After placing the Expa-syl select a corresponding Comprecap that is sized for the tooth you are prepping, then have the patient bite down on the Comprecap. If done correctly the Comprecap drives the Expa-syl into the sulcus widening it mechanically as well as through the action of the Expa-syl. Works great!

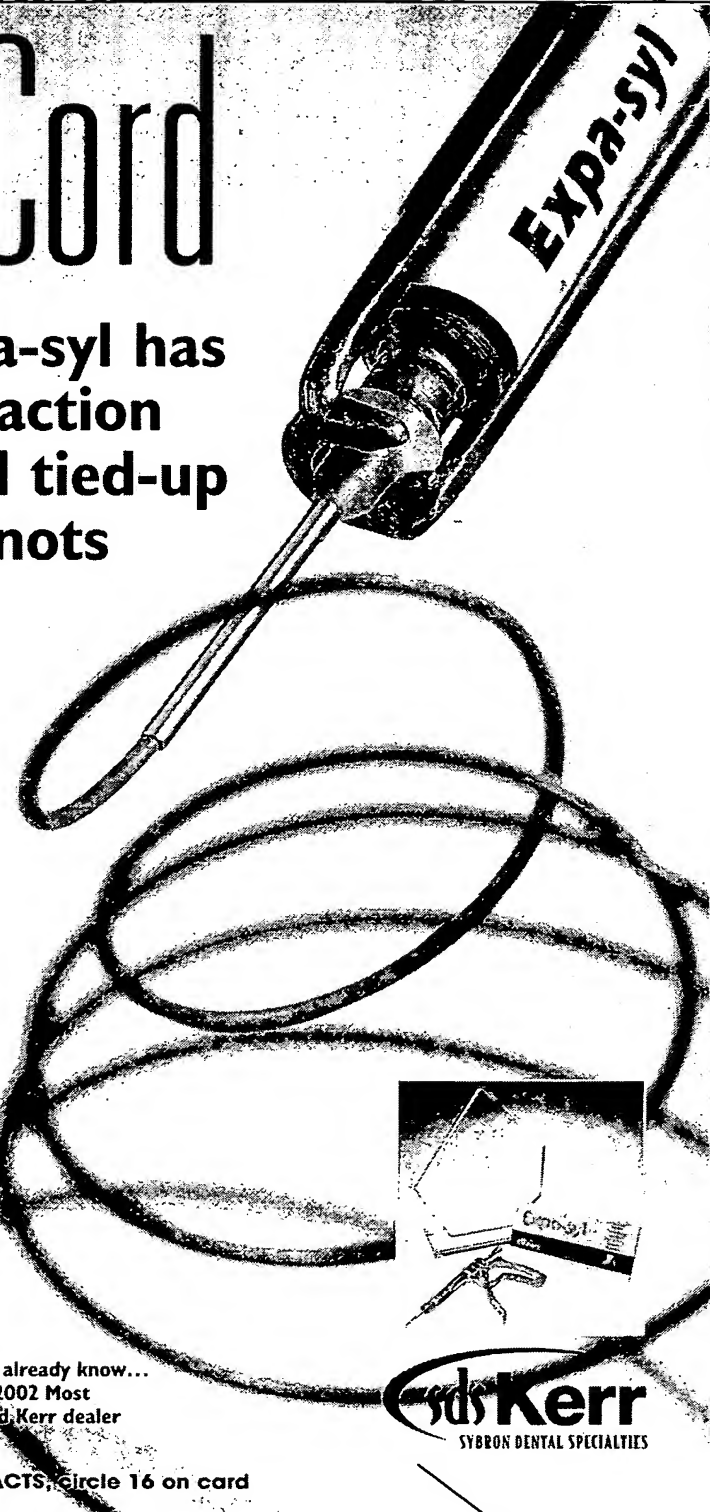

Want to know more? This is just a sample of the information available on the message boards at www.dentaltown.com in the Personal Evaluations/ Recommendations-Search Words (typed exactly): Expa-syl.

Cut The Cord

Expa-syl has retraction cord tied-up in knots

A safe, painless breakthrough for gingival retraction. Expa-syl is injected into the sulcus, physically displacing the tissue. Easy application. Easy on the patient.

Left for 1-2 minutes and then rinsed, Expa-syl's aluminum chloride controls bleeding (and re-bleeding) and crevicular seepage. Timesavings.

It leaves the sulcus open and dry. Excellent marginal access. Excellent retraction.

Combine Expa-syl with the hydrophilic properties of Take 1 polyvinyl impression material and you have an easy-to-read impression with every detail rendered clearly and accurately.

Don't be the last to discover what your colleagues already know... that you can cut the cord with Expa-syl. Reality's 2002 Most Innovative Product of the Year. Call your authorized Kerr dealer or 800-KERR-123. Visit us at KerrDental.com.

Combination case - Bicon
Posted on 02/26/2004 by [zahnmann](#)

This patient was a long time patient of a 68 y.o. dentist whose practice had been in decline for many years.

When he first presented he wanted the same old patchwork dentistry and was petrified of needles and dental work. We used oral sedation and accomplished what I think turned out to be one of my favorite cases. I used Bicon implants and o-ring type attachments.

Pre-op condition. Assistant keeps getting the collar in the panos.

3 Bicon 4.5X11 and 1 Bicon 5X8 Implants placed

We were able to salvage #11 to #15
